

PROBLEM STATEMENT

atomcamp is an emerging tech education ecosystem offering a range of programs, bootcamps, and learning resources designed to upskill learners across Pakistan and beyond. As the learner base grows and course offerings diversify, atomcamp faces a familiar but critical challenge: no two learners are alike — yet most learning systems treat them as if they are.

Today, learners navigate a static catalogue of content with little personalization, instructors have limited visibility into who is struggling and why, and the platform lacks a unified system that ties together goals, progress, feedback, and outcomes.

Design and build an integrated Smart Adaptive Learning Management System (LMS) for atomcamp that personalises the learning journey for each student, from onboarding to course completion, while giving instructors and administrators actionable intelligence to improve outcomes at scale.

Your solution should be informed by a thorough review of Atomcamp's existing website and product offerings at atomcamp.com. Use what you find as the foundation — the programs, the audience, the gaps, and build on top of it.
